Second Annual Evaluation of MSU/RTA Alternative Preservative Study

This report covers the second annual evaluation of the full length crossties exposed as part of the MSU/RTA alternative preservative study. A visual evaluation of the exposed top surface was conducted for all ties at both exposure sites. One tie from each treatment group, at both sites, was selected at random to be examined on all four surfaces and to be cross-cut near the inner spike holes for interior evaluation.

General Observations:

No unexpected results were found. Checking and/or splitting appeared worse at Site 2 probably due to more direct sunlight exposure. Ties at Site 1 appeared to be more moist/wet due to the increased shade and leaf litter at this site.

General photographs documenting the condition of the sites and some of the noted deterioration can be seen below (Figures 1 - 10). The tie number denotes the position of exposure as recorded on the plot-maps. Copies of the inspection forms as well as photographs of the segmented ties can be found in the appendix.

Figure 1 - An overall view of exposure Site 2 illustrating the conditions at the time of inspection.

Figure 2 - A general photograph demonstrating the exposure conditions at Site 1 after the inspection.

Site 1 - Dorman Lake Test Site

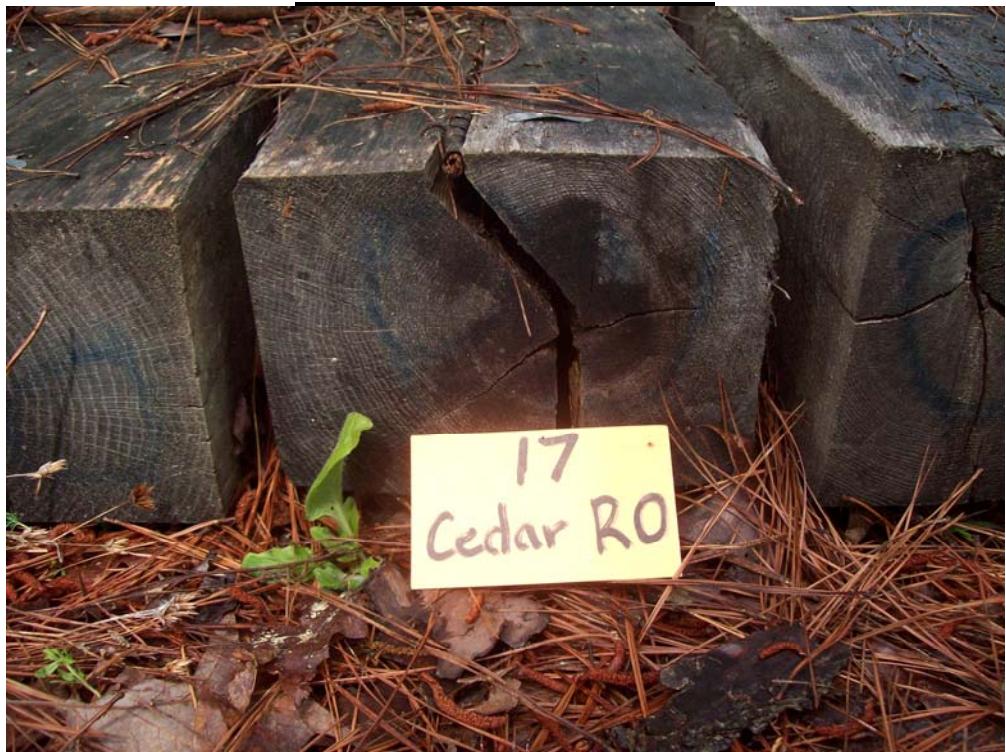

Figure 3 - Tie #17 (Cedarcide/red oak) showing splitting.

Figure 4 - Tie #151 (Nisus/white oak/borate/oil B) with heavy checking.

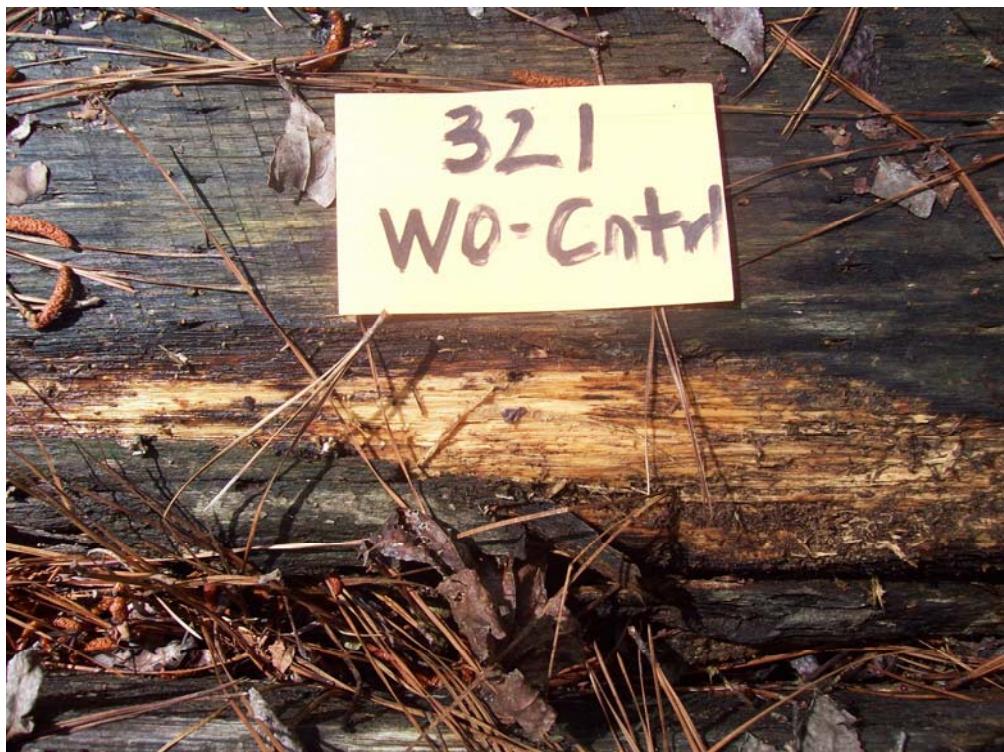

Figure 5 - Tie #321 (white oak/untreated) showing signs of obvious decay.

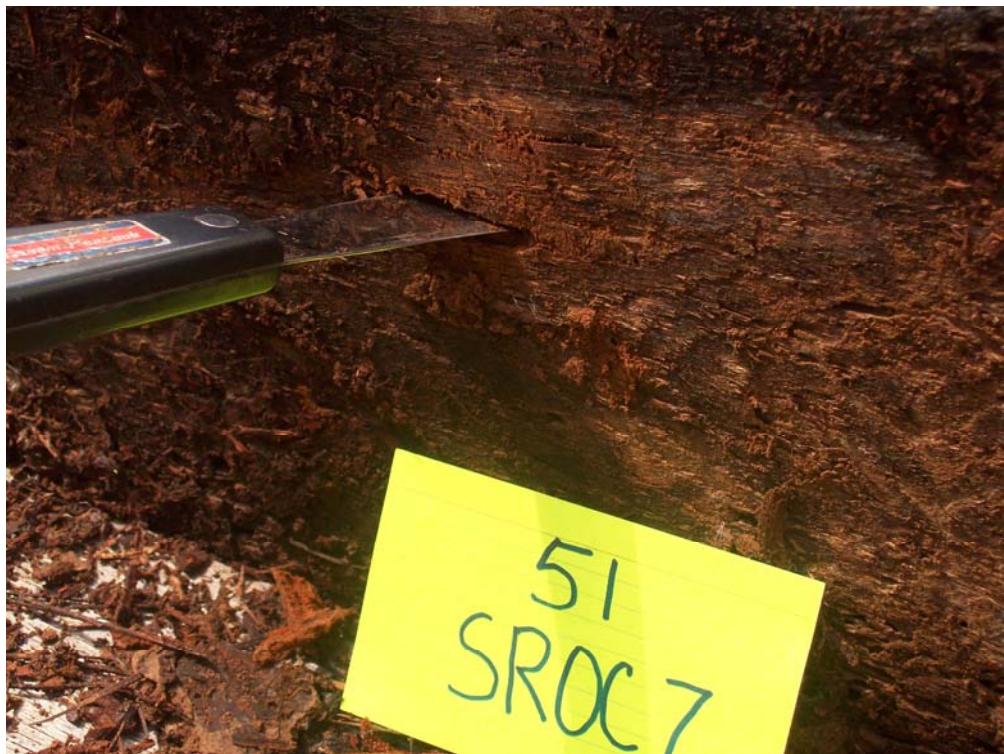

Figure 6 - Tie #51 (red oak/untreated) with penetrating decay pocket.

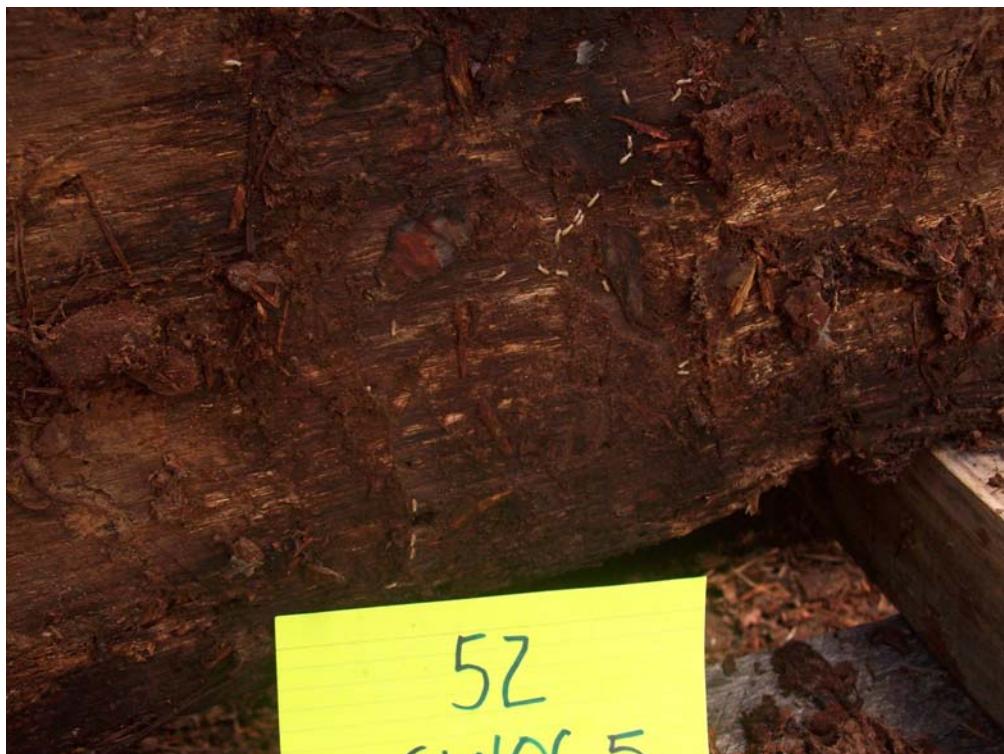

Figure 7 - Tie #52 (white oak/untreated) with live termites at the time of inspection.

Site 2 – Formosan Termite Research Facility

Figure 8 - Tie #84 (Lonza/red oak) with light decay.

Figure 9 - Tie #130 (Nisus/red oak/borate only) with checking.

Figure 10 - Untreated tie with decay.
