Third Annual Evaluation of Phase II MSU/RTA Alternative Preservative Study

This report covers the 3rd annual evaluation of the full length crossties exposed as part of the MSU/RTA Phase II alternative preservative study. A visual evaluation of the exposed top surface was conducted for all ties at both exposure sites. Random ties from various treatment groups, at both sites, were selected to be examined on all four surfaces.

General Observations:

No unexpected results were found. Site 2 ties appeared to be a drier probably due to more direct sunlight exposure allowing for more checking. Ties at Site 1 appeared to be more moist/wet due to the increased shade and leaf litter at this site and thus more sign of incipient decay were noted at this site.

General photographs documenting the condition of the sites and some of the noted deterioration can be seen below (Figures 1 - 8). The tie number denotes the position of exposure as recorded on the plot-maps. Copies of the inspection forms can be found in the appendix.

Figure 1 - An overall view of exposure Site 2 illustrating the conditions at the time of inspection.

Figure 2 - A general photograph demonstrating the exposure conditions at Site 1 at the time of inspection.

Site 1 - Dorman Lake Test Site

Figure 3 - Tie #99 (unt. white oak) showing trace amounts of decay.

Figure 4 – Tie #21 (unt. red oak) tie with light decay.

Figure 5 - Tie #104 (D-fir untreated) with light decay.

Site 2 – Formosan Termite Research Facility

Figure 6 - Tie #106 (unt. D-fir) with visible decay.

Figure 7 - Tie #249 (unt. red oak) with severe split and decay fruiting bodies on end grain.

Figure 8 -Tie #40 (unt. white oak) with decay and beetle damage.

APPENDIX:
